LDL-RECEPTOR CLASS A 2.
LDL-RECEPTOR CLASS A 3.
LDL-RECEPTOR CLASS A 4.
LGL-RECEPTOR CLASS A 4.
LGL-RECEPTOR CLASS A 4.
LGMININ BGF-LIKE 1 (N-TERMINAL).
LAMININ BGF-LIKE 1 (C-TERMINAL).
LAMININ BGF-LIKE 2.
LAMININ EGF-LIKE 2.
-1- SIMILARITY: Contains 3 laminin IV domains.
-1- SIMILARITY: Contains 15 immunoglobulin-like C2-type domains.
-1- SIMILARITY: Contains 3 laminin G-like domains.
-1- SIMILARITY: Contains 1 EGF-like domain.
-1- SIMILARITY: Contains 1 SEA domain.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Signal; Basement membrane; Proteoglycan; Repeat, Glycoprotein; Heparan sulfate; Laminin EGF-like domain; Immunoglobulin domain; Extracellular matrix; EGF-like domain; 3D-structure.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               BASEMENT MEMBRANE-SPECIFIC HEPARAN SULFATE PROTEOGLYCAN CORE PROTEIN.

Submitted (FEB-1998) to the EMBL/GenBank/DDBJ databases.
-! FUNCTION: Probable role in myofilament assembly and/or attachment
of the myofilament lattice to the cell membrane. May be an
extracellular anchor for integrin receptors in muscle.
-! SUBCELLULAR LOCATION: Extracellular matrix.
-! ALTERNATIVE PRODUCTS:
-: Event=Alternative splicing; Named isoforms=4;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        SEQUENCE PROM N.A. --- TISSUB SPECIFICITY: Embryonic nervous system and muscle.
--- DEVELOPMENTAL STAGE: More abundant early in development.
--- DTM: Contains heparan sulfate chains as well as N-linked and O-linked oligosaccharides (By similarity).
--- SIMILARITY: Contains 9 Kazal-like domains.
--- SIMILARITY: Contains 2 laminin EGF-like domains.
--- SIMILARITY: Contains 4 EGF-like domains.
--- SIMILARITY: Contains 1 SEF-like domains.
--- SIMILARITY: Contains 3 laminin G-like domains.
--- SIMILARITY: Contains 3 laminin G-like domains.
--- SIMILARITY: Contains whether Met-1, Met-18 or Met-24 is the
Event=Allernative splicing; Named isoforms=5;
Comment=Additional isoforms seem to exist. Isoforms differ in
their acetylcholine receptor clustering activity;

Tessiar-Lavinge M., Kidd T.;
Slit proteins bind Robo receptors and have an evolutionarily conserved role in repulsive axon guidance.";
Call 96:795-806(1939).
--- FUNCTION: Playe a role in axon guidance as a repulsive ligand for Robo receptors preventing inappropriate midline crossing.
--- SUBGNILULAR LOCATION: Secreted. The C-terminal cleavage protein is more diffusible than the larger N-terminal protein that is more tightly cell associated.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    "Distinct but overlapping expression patterns of two vertebrate slit homologs implies functional roles in CNS development and organogenesis.";

SUBCELLULAR LOCATION: Integral membrane protein.
-1. SUBCELLULAR LOCATION: In the pupal wing, expressed at relatively
even levels in all regions. Abundant in 6-9 hour embryos.

EXPLESSED at higher levels in pupae than larvae.

-1. DEVELOPMENTAL STAGE: At 12 hours after puparium formation (apf),
expressed evenly at cell boundaries. By 30 hours apf, expression
is concentrated at proximal and distal cell boundaries with little
or no expression at anterior and posterior boundaries. When
prehairs emerge at 30-36 hours apf, expression becomes evenly
distributed again along the whole cell boundary.

-1. SIMILARITY: Contains 8 cadherin domains.
-1. SIMILARITY: Contains 2 laminin Glike domains.
-1. SIMILARITY: Contains 1 GPS domain.

systematic review.",
Genome Biol. 3:RESEARCH0083.1-RESEARCH0083.22(2002).
-!- FUNCTION: Involved in the fz signaling pathway that controls wing
tissue polarity. Also mediates homophilic cell adhesion. May play
a role in initiating prehair morphogenesis. May play a critical
a role in tissue polarity and in formation of normal dendrite
                                                                                                                                                                                                                                                                                                                                                                                                                                                                        MEDLINE=22426069; PubMed=12537572;

SUBUNIT: The laminin G-like domain 2 binds to neurexophilin 1.

1 soforms alpha 4B bind to alpha-dystroglycan. The cytoplasmic C-terminal region binds to CASK.

1 soforms seems to CASK.

1 SOURCELLUIAR LOCATION: Type 1 membrane protein (Potential). Some isoforms seems to be secreted.

1 ALTERNATIVE RROUGTS:

2 Comment=Alternative splicing; Named isoforms=1; Comment=At least 288 isoforms may be produced by alternative splicing. There is a combination of five alternative splicing. There is a combination of five alternative splicing. There is a combination of five alternative splicing. There is a combination of five alternative spliced domains at sites 1, 3, 4 and 5, each consisting of modular sequences (A-L) that seem to be used independently. Isoforms Alpha 5H-type lack the transmembrane domain;

2 Splicing: The Alpha 5H-type lack the transmembrane domain;

3 Isola-007310-1; Sequence=Displayed;

3 Isola-007310-1; Sequence=Displayed;

4 Isola-007310-1; Sequence=Displayed;

5 INTILARITY: Contains 6 laminin G-like domains.

5 INTILARITY: Contains 3 ESF-like domains.

5 INTILARITY: Belongs to the neurexin family.
                                                                                                                                              With neurexins...

Medication of the coding sequences of unidentified human genes. VI. Prediction of the coding sequences of unidentified human genes. VI. The coding sequences of 80 new genes (KTAA0201-KTAA0280) deduced by analysis of CDNA clones from cell line KG-1 and brain.";

PUNCTION: Receptor that may have an important role in cell/cell signaling during nervous system formation.

SUBCELLULAR LOCATION: Integral membrane protein.

-I SISUE SPECIFICITY: Highest expression in brain and testis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Bukaryoča, Metazoa, Chordata, Craniata, Vertebrata, Buteleostomi,

-1- FUNCTION: Binding to cells via a high affinity receptor, laminin is thought to mediate the attachment, migration and organization of cells into tissues during embryonic development by interacting with other extracellular matrix components.

-1- SUBUNIT: Laminin is a complex glycoprotein, consisting of three
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         [4]
